1. (True/False) A simplified way to interpret K Nearest Neighbors is by thinking of the output of this method as a decision boundary which is then used to classify new points.

1 / 1 point

☒ True

Correct! You can find more information in the lesson *K Nearest Neighbors Decision Boundary*.

☐ False

2. These are all characteristics of the k nearest neighbors algorithm EXCEPT:

1 / 1 point

- ☐ It is sensitive to scaling
- ☐ It determines decision boundaries to make predictions
- ☒ It determines the value for k

Correct! The value of k is a hyperparameter that needs to be determined and optimized.

☐ It is well suited to predict variables with multiple classes
